A 2-pixel line

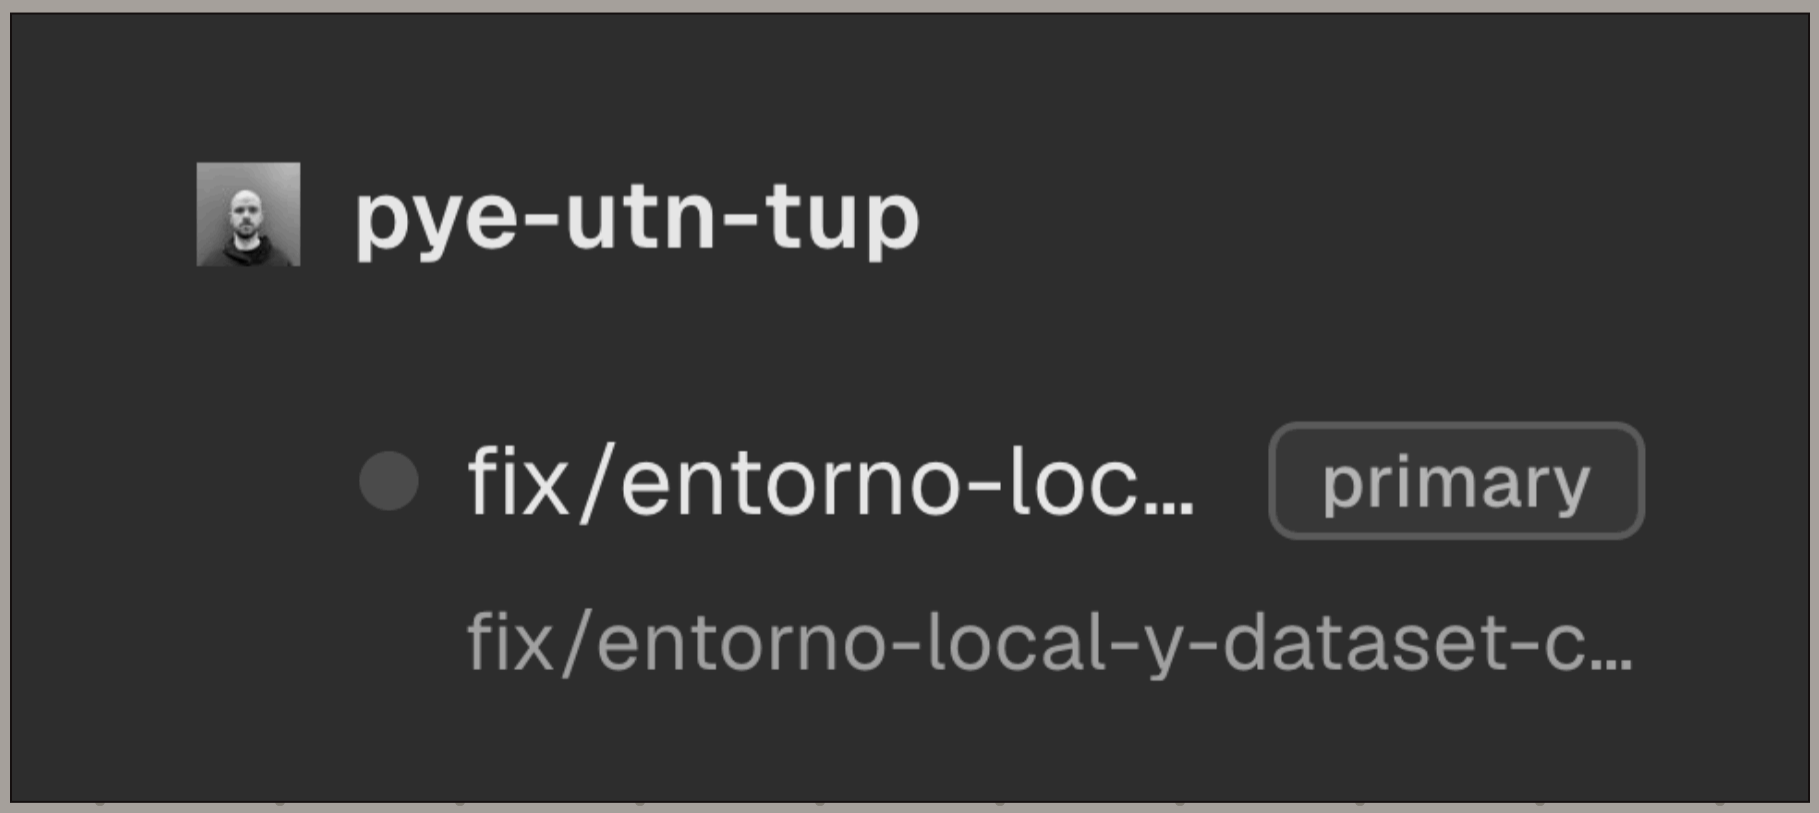

Sometimes the bigger contribution isn't a tool of your own. It's one detail in someone else's.

Which one did I leave dirty?

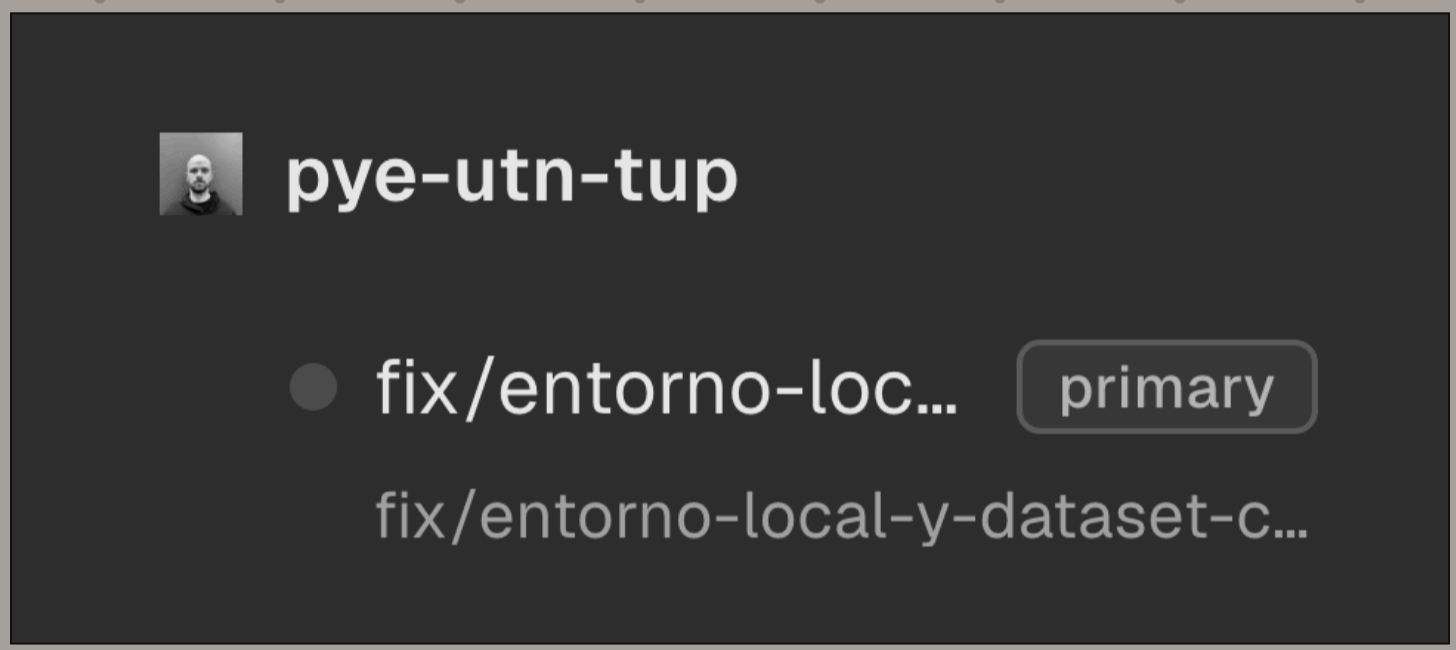

Orca runs coding agents side by side, each one in its own git worktree, and each worktree is a card in the sidebar.

With many of them open, every card looked the same whether its checkout was clean or not. The only way to know was to open them one by one.

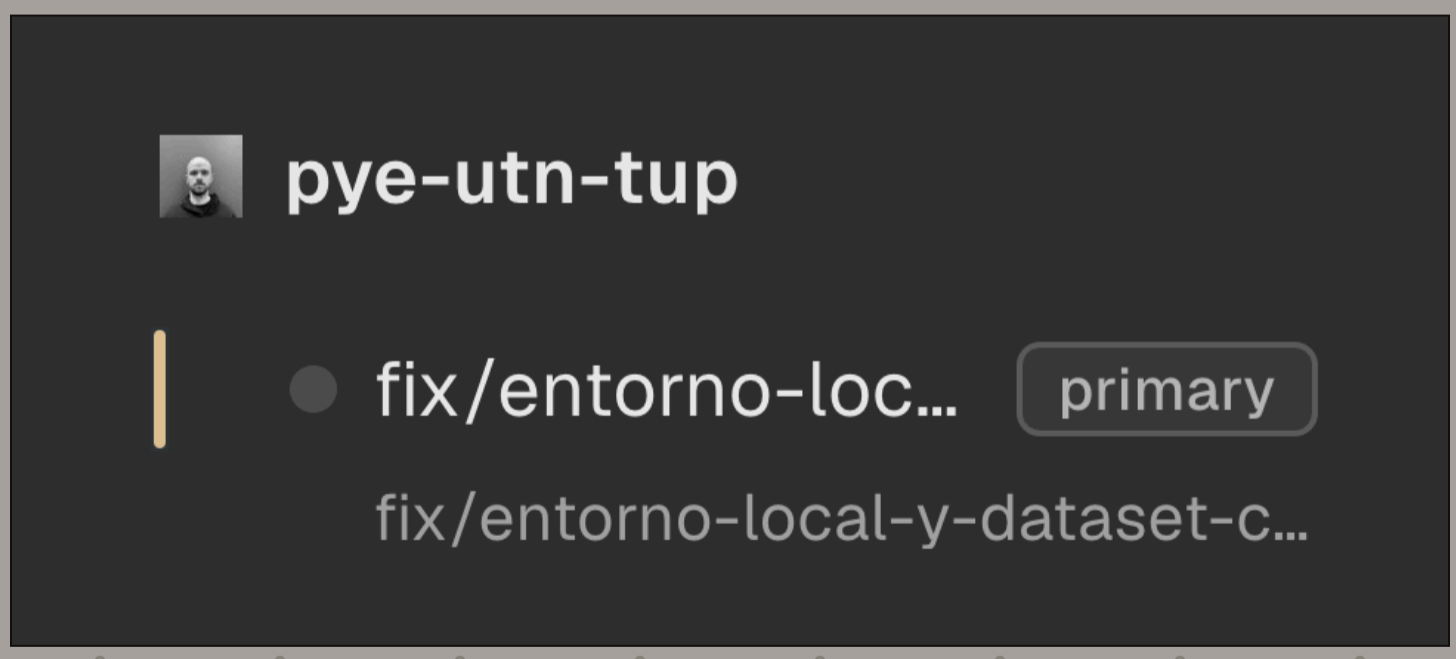

Before · a card with one uncommitted change

Same card, one stripe

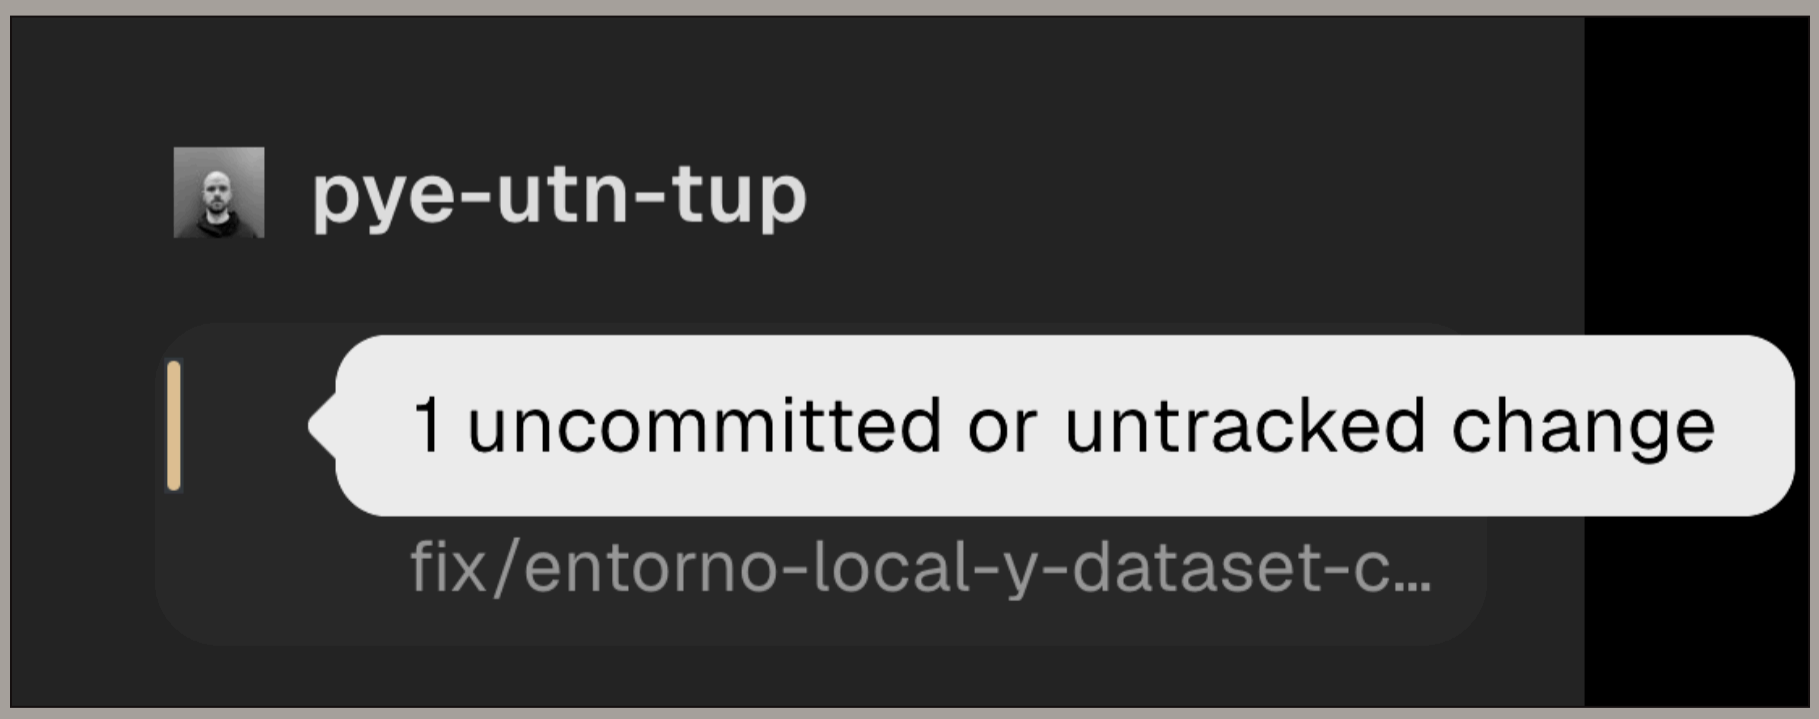

Before

After · a 2 px stripe, in the colour for modified files

The count, not just a mark

Hover the stripe and it tells you how many files changed. Past git's listing limit it says "N+" instead of guessing. Clean cards show nothing, and so do the ones not read yet.

The work was in the reading

Showing a line is easy. Knowing when to draw it, without putting git to work on every checkout, is the change.

ON SCREEN ONLY	It reads the visible cards, one at a time, at background priority.
ACTIVE CARD	Zero extra work: Orca already tracks it, so the stripe reuses that.
REMOTE SSH	Same behaviour on remote hosts. Disconnected ones are skipped.
OFF SWITCH	A setting under Appearance, on by default.

Live test · new file: stripe in 17 s · deleted: gone in 74 s

Now all that's left is to wait

ISSUE	PULL REQUEST	STATUS
#34521	#34557	Ready

First the issue, with the before and a mockup. Then the pull request, with tests, before and after captures, and the project's own checks.

Orca is open source, with close to 108,000 stars on GitHub. The pull request, the issue and the project are in the first comment.
